Process of Solving:

entered ' or 1=1-- into password box

Writeup:

Congratulations on beating the mission again.

No credits were rewarded, but it's good to see you're testing your skills again.

[Return to Enigma Main](#)

SQL Injection is one of the most dangerous exploits which you will find in any web application. It can allow you to modify the query which you send to the server to your advantage.

The injection which you used forces the query to return all records in the database where 1=1. This will return every value in the database as everyone knows that 1=1!

There are a variety of different methods with a coder can use to prevent this. In all cases using MySQL and PHP you should use the `mysql_real_escape_string()` function, however you should change this to suit your specific application.
